SUMMARY

Energy and strategy professional with 7+ years of experience across strategic project development, power generation, utility consulting, and data center research. Experienced in evaluating technical and commercial solutions, developing business cases and proposals, and managing cross-functional relationships with customers, vendors, contractors, and engineering teams. Combines hands-on power infrastructure experience with techno-economic analysis, data-driven decision making, and project execution in complex industrial environments.

PROFESSIONAL EXPERIENCE

Strategic Project Development Engineer, Taber International, USA

Jan 2026 – Present

- Lead 6+ concurrent client projects across energy and industrial systems, owning technical evaluation, project planning, testing, stakeholder coordination, risk resolution, and delivery from early scoping through implementation.
- Manage direct client engagements and develop RFIs, scopes, and technical-commercial proposals, translating operational needs into executable solutions and supporting a pipeline of \$1M+ in project opportunities.
- Lead cross-functional execution across clients, engineering teams, and leadership, prioritizing resources, resolving technical dependencies and scope boundaries, and communicating project risks and decisions to executives.
- Standardized engineering workflows by converting legacy analytical programs into reusable Python models and scalable equipment-performance tools, improving consistency and creating long-term capabilities across multiple client projects.
- Conduct site assessments, operational data analysis, and cost-benefit evaluations to identify performance opportunities, consolidate technical and implementation risks, and recommend investment priorities to clients and company leadership.

Enterprise Architect Intern, EPE Consulting, USA

May 2025 – Dec 2025

- Synthesized technology initiatives, cost savings, implementation risks, and project dependencies into executive-level reporting, supporting portfolio prioritization and enterprise modernization decisions for a major U.S. utility.
- Developed business cases and techno-economic analyses for grid modernization and thermal energy storage initiatives, identifying \$250K+ in annual savings and \$100K+ in implementation cost avoidance.
- Evaluated emerging technologies through industry benchmarking, stakeholder requirements, and cost-benefit analysis, translating findings into strategic recommendations for digital transformation and senior utility stakeholders.

Operations and Strategy Engineer, MAHAGENCO Ltd, India

Jul 2018 – Jul 2024

- Led operations of a 630 MW generation unit with 20+ engineers, operators, and contractors, allocating people and equipment across operating priorities while training junior engineers on plant procedures.
- Coordinated vendors and contractors for major outages and plant overhauls, evaluating technical bids, defining work scopes, and resolving delivery and execution issues across \$1M+ in annual operating activities.
- Standardized operating procedures, checklists, and root-cause practices across shifts, led 30+ equipment-level and 5 plant-wide investigations to reduce recurring failures and strengthen equipment reliability.
- Analyzed equipment performance and operating trends to prioritize improvement projects, contributing to a 16% efficiency improvement, heat rate below 2,750 kcal/kWh, and oil consumption below 1.4 ml/kWh.
- Used SAP ERP for material planning and maintenance coordination, aligning spares, vendor activities, equipment readiness, and outage schedules to reduce execution and availability risk.

RESEARCH WORK

Climate-Sensitive Techno-Economic Analysis of Data Center Cooling Technologies

DOI: 10.3390/en19173947

Evaluated cooling technologies across climates using hourly energy modeling, lifecycle cost, NPV, IRR, and payback.

Long-Duration Energy Storage Selection & Its Techno-Economic Assessment

Manuscript Under Review

Compared 6 grid-scale storage technologies using technical constraints to identify least-cost feasible solutions.

Sensitivity Analysis and Operational Optimization of Data Center Cooling with ATES

Research in Progress

Evaluating key parameters to identify performance sensitivities and optimize ATES, free-cooling, & chiller utilization.

SKILLS

- **Strategic & Project Management:** Technical bid evaluation, RFI development, Scope-of-work definition, Vendor & contractor management, Cost-benefit analysis, Resource prioritization, Risk management, Executive reporting, Team development
- **Leadership & Operations:** Team leadership, Talent development, Process standardization, Power generation, Data center & energy infrastructure
- **Tools & Certifications:** Supply Chain Foundations, LEED AP, Lean Six Sigma Green Belt, AWS Cloud Practitioner, SAP ERP, Python, SQL, HTML, Power BI, Microsoft Excel, PowerPoint
